                                                                                                                                Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           A_Geneseq_101002:*

Methods are provided for large-scale purification of neurotrophins, including mature NT-3, suitable for clinical use. A claimed method comprises: (1) separating the neurotrophin from the cither proteins using a hydrophobic interaction chromatography resin (HICR); and optionally (2) separating the neurotrophin from a certifical variant by high performance cation exchange chromatography (1) (HICEC). The processes can also be used for purification of e.g. chuman nerve growth factor (NGF) (see AAW4888), mouse NGF (see AAW48887), brain-derived neurotrophic factor (see AAW48888) and neurotrophin-4/5 (see AAW48890). The processes allow separation of neurotrophins from various undesirable misprocessed, misfolded, csize, glycosylated or charge forms. They allow selective separation from variants and other molecules, and from other college with high pl. The processes are applicable to starting materials from various sources, including fermentation cc broths or lysed bacterial or mammalian cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

NT-4/5 may also be used to treat diseases induced by gram positive, gram negative and acid-fast bacteria.
                                                                                                                                                                                                                                                                                  The present invention relates to treating ototoxin-induced neuronal-related balance impairment in a mammal by administering a neuronal-related balance impairment in controphin-4/5 (NT-4/5). Ototoxicity-related balance impairments include Meniere's syndrome, myringitis, otilis media, acute vestibular neuronitis, herpes zoste oticus, labyrinthitis, middle or labyrinthe tumours, petrositis and
                                                                                                                                                                                                                                                                                                                                                                                                                                            Treating ototoxin-induced neuronal-related balance impairment and promoting vestibular ganglion neuron survival prior to, upon or a exposure to an ototoxin, comprises administering a trkB or trkC a
                                                                                                                                                                                                   Sequence
                                                                                                                                                                                                                                  present sequence is a protein used in the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    NT-3 is a new neurotrophic factor and is a member of the NGF/BDGF gene family. The sequence was deduced from the DNA sequence of a clone isolated from a human placental genomic DNA library using probes prepd. from sequences of NGF and BDGF. The clone contg. the longest insert was designated phihN3(G1).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The sequences given in AAR37800-01 represent human and rat
CC neurotrophin-3 (NT-3) respectively. NT-3 has a similar structure to
CD brain derived neurotrophic factor (BDNF) and nerve growth factor (NGF).
CC A putative signal sequence of 18 amino acids is followed by a prosequence
CC of 121 amino acids. The 6 Cys residues present in NGF and BDNF are
CC conserved in NT-3 and are thought to be involved in the formation of
CC disulphide bridges. A high degree of homology is noted between rat and
CC human NT-3 within the region encoding the mature protein. The amino
CC acid sequences of the mature proteins appear absolutely identical. NT-3
CC is capable of promoting survival and neurite outgrowth of dissociated
CC dorsal root ganglion neurons in culture. NT-3 is observed to promote
CC neurite outgrowth from both nodose ganglion but not sympathetic
CC ganglion, and NGF promoted outgrowth from sympathetic ganglion but
CC not nodose explants. Therefore NT-3 appears to have a broader
CC specificity of action than either BDNF or NGF.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAR29493-95.
                                                                                  Sequences are provided for rat nerve growth factor (AAR54084), rat brain-derived neurotrophic factor (AAR54085) and rat neurotrophin-3 (AAR54086). Chimeric neurotrophins capable of binding TrkA, TrkB ar TrC are obtained by substituting amino acids 3-9, 28-37, 40-49, 61-66, 81-88, 94-98 or 95-97 of a neurotrophin with corresponding amino acids from NGF, BDNF or NT-3. Recombinant chimeric neurotrophins are used to treat e.g. Alzheimer disease and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Qy
                                                                            cc factor (NGF) with substitutions at amino acid positions: 623 and H84, and CC one or both of V18 and V20, so that it acquires the ability to bind trkC. CT he variants can be used to promote development, maintenance and CC regeneration of neurons in vivo or in vitro, so can be used to treat a CC wide range of neural diseases, e.g. Alzheimer's, Parkinson's, CC Huntington's and Meniere's diseases; stroke; amyotrophic lateral CC sclerosis; epilepsy; Down's syndrome; nerve deafness; Bell's palsy, or CC sclerosis; epilepsy; Down's syndrome; nerve deafness; Bell's palsy, or CC sclerosis; epilepsy; Down's syndrome; nerve deafness; Bell's palsy, or CC standards for neurotrophin assays; as additives for nerve cell culture CC endia, and for generation of specific antibodies. By introducing trkC complete the culture controphic factor NT-3 while optionally retaining ability to bind trkA candors B and therefore provide several activities in a single molecule, CC with more predictable pharmacokinetic and other properties than a mixture of agents each with a single activity, and better pan-neurotrophic activity than known compounds.

                                                                                                                                                                                                                                                                                                                                                       rne present invention provides a number of nerve growth factor (NGF) variants with trkC-binding activity and trkC-signal inducing activity. They may also be capable of binding to trkA and trkB. The variants are useful in the treatment of neuronal disorders, including peripheral neuropathy and motor-neurone disorders, such as amyotrophic lateral sclerosis, Bell's palsy, and various conditions involving spinal muscular atrophy, or paralysis. They are also useful for treating other human neurodegenerative disorders, such as Alzhelmer's disease, Parkinson's disease, periphersy, multiple sclerosis, Huntington's disease, Down's Syndrome, nerve deafness, Meniere's disease and other conditions characterized by necrosis or loss of neurones, whether central, peripheral, or motor neurons.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention relates to a matrix comprising a substrate capable of CC providing attachment of a heparin binding peptide (HBP), a peptide CC comprising a binding domain which binds heparin with high affinity, CC comprising a binding domain which binds heparin with high affinity, CC included in the invention is a vascular graft comprising the matrix, CC which is capable of supporting cell adhesion. The matrix is used for CC delivering low heparin binding affinity growth factor proteins or CC peptides in a controlled manner suitable for wound healing. The matrix CC can be used in an article for treating dermal wounds, and in an CC implantable sterilized composition capable of supporting cell adhesion. The present sequence represents a growth factor protein. The protein is cused in an article for treating that non-heparin-binding growth factors can be released in a controlled manner from heparin-based drug delivery cused in a controlled manner from heparin-based drug delivery cused in a controlled manner from heparin-based drug delivery cused in a controlled manner from heparin-based drug delivery cused in a controlled manner from heparin-based drug delivery cused in their low affinity for heparin-based drug delivery cused in the controlled manner from heparin-based drug delivery cused in the controlled manner from heparin-based drug delivery cused in the controlled manner from heparin-based drug delivery cused in the controlled manner from heparin-based drug delivery cused in the controlled manner from heparin-based drug delivery cused in the controlled manner from heparin-based drug delivery cused in the controlled manner from heparin-based drug delivery cused in the controlled manner from heparin-based drug delivery cused in the controlled manner from heparin-based drug delivery cused in the controlled manner from heparin-based drug delivery cused in the controlled manner from heparin-based drug delivery cused in the controlled manner from heparin-based drug delivery cused in the controlled manner from heparin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

                                                                                                                                                                                                                                                  and methoxypolyethylene glycol, a water soluble polymer. The modification may be at the N-terminal alpha-amino group of NT-3 or on one or several of the lysine epsilon-amino acid groups of NT-3. These derivatives, and similar derivatives of brain derived growth factor (BDGF) have the same uses as the trophic factors BDNF and NT-3. They are useful for promoting the survival and maintenance of neurons in vitro and in vivo, and for treating neurodegenerative diseases, e.g. Parkinson's disease, amyotrophic lateral sclerosis, Huntington's disease, retinal degeneration, peripheral neuropathies or Alzheimer's disease. Use of the derivatives improves migration of BDNF or NT-3 through brain tissue, resulting in easier delivery to targets within the brain.

                                                                                                                                                                                                                                                                                                                                                                           This sequence is human neurotrophin 3 (NT-3). Active NT-3 is produced by the method of the invention, which comprises transforming a prokaryotic host cell with an NT-3 gene to express the NT-3, and then NT-3 produced is refolded correctly in a redox buffer. The active NT-3 produced by the method can be used as a reagent for research on the differentiation of

```
The present invention relates to a method for production of a polypeptide analogue of a cattonic polypeptide selected from 4 fully defined polypeptide sequences, where the polypeptide analogue has an isoelectric point which is lower and an in vivo circulating life and/or absorption which is increased relative to those properties in unmodified neurotrophic factor 3 (NT-3). The method is useful for producing certain analogues of NT-3 which have a relatively lower pi, yet retain the structure and biological activity of the protein in its 'native' state, to assess the impact of the pi on the pharmacokinetic behaviour of proteins. The present sequence is human recombinant neurotrophic factor-3 (NT-3), r-methum-3. This sequence is recombinantly produced in E. coli bacterial cells and thus expressing the methionine residue at

The filter was screened with labelled DNA coding for human beta-NGF as a probe. A positive clone was designated "lambda beta-GN1321" and was digested with EcoRI. The insert was cloned in EcoRI-digested pUCl18 to give plasmid pUNK5. The CDNA insert was sequenced and the deduced amino acid sequence was found to have 60 per cent homology to human beta-NGF. The invention relates to an antibody to a peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Peptide

(See also AAQ27510-11). NGF2/NT-3 is highly expressed in the human hippocampus and cerebellum. It is expressed more highly in newborn animals than in adults. It acts on expressed more highly in newborn animals than in adults. It acts on nerve cells, such as nodose ganglion derived nerve cells and is thought to play a key role in nervous system development. The NGF2/NT-3 obtained by culturing plasmids pTB1339 or pTB1344 may be used as a reagent for research on the brain and nervous system and may be expected to serve as a therapeutic drug for senile dementia. The plasmid vectors used allow production of NGF2/NT-3 stably and in
